

## 1 Introduction

Piksi Firmware has a number of settings that can be controlled by the end user via the provided Piksi Console or through the SBP binary message protocol. This Document serves to enumerate these settings with an explanation and any relevant notes. If a setting is listed as "Expert" in this document, the `-expert` command line argument must be passed to the Piksi Console in order to see or modify the value.

DRAFT

## 2 Settings Table

| Grouping           | Name                | Description  |
|--------------------|---------------------|--|
| <b>acquisition</b> | sbas enabled        | Enable the SBAS constellation  |
| <b>ext events</b>  | edge trigger        | Select DEBUG0 edges to trigger timestamped event capture.  |
| <b>float kf</b>    | phase var           | Assumed variance of a satellite's phase measurement  |
|                    | code var            | Assumed variance of a satellite's pseudorange measurement  |
|                    | amb init var        | Initial integer ambiguity variance at filter initialization  |
|                    | new amb var         | Variance for new ambiguity measurements  |
| <b>frontend</b>    | antenna selection   | Determines which antenna to use.   |
| <b>iar</b>         | phase var           | Determines the measured carrier phase variance for use in the integer ambiguity resolution test loop |
|                    | code var            | Determines the pseudocode variance for the integer ambiguity resolution subroutine                   |
| <b>nmea</b>        | gppll msg rate      | Number of ticks between GPPLL NMEA messages being sent.  |
|                    | gpgsv msg rate      | Number of ticks between GPGSV NMEA messages being sent.  |
|                    | gprmc msg rate      | Number of ticks between GPRMC NMEA messages being sent.  |
|                    | gpvtg msg rate      | Number of ticks between GPVTG NMEA messages being sent.  |
|                    | gpgsa msg rate      | Number of ticks between GPGSA NMEA messages being sent.  |
|                    | gpzda msg rate      | Number of ticks between GPZDA NMEA messages being sent.  |
| <b>openlog</b>     | file prefix         | Prefix for OpenLog filenames   |
| <b>pps</b>         | width               | Number of microseconds the PPS will remain high (1-999999).  |
| <b>sbp</b>         | obs msg max size    | Determines the maximum message length for raw observation sbp messages.                              |
| <b>simulator</b>   | mode mask           | Determines the types of position outputs for the simulator.  |
|                    | radius              | Radius of the circle around which the simulated Piksi will move                                      |
|                    | base ecef x         | Simulated base station position  |
|                    | base ecef y         | Simulated base station position  |
|                    | base ecef z         | Simulated base station position  |
|                    | speed               | Simulated tangential speed of Piksi  |
|                    | phase sigma         | Standard deviation of noise added to the simulated carrier phase                                     |
|                    | pseudorange sigma   | Standard deviation of noise added to the simulated pseudo range                                      |
|                    | cn0 sigma           | Standard deviation of noise added to the simulated signal to noise ratio                             |
|                    | speed sigma         | Standard deviation of noise addition to simulated tangential speed.                                  |
|                    | pos sigma           | Standard deviation of simulated single point position  |
|                    | num sats            | The number of satellites for the simulator.  |
|                    | enabled             | Toggles the Piksi internal simulator on and off  |
| <b>solution</b>    | known baseline d    | Determines the baseline vector for the "init known baseline" feature.                                |
|                    | known baseline e    | Determines the baseline vector for the "init known baseline" feature.                                |
|                    | known baseline n    | Determines the baseline vector for the "init known baseline" feature.                                |
|                    | dgnss solution mode | Determines the type of RTK solution which will be output.  |

|                          |                                   |   |
|--------------------------|-----------------------------------|---|
|                          | output every n obs                | Integer divisor of solution frequency for which the observations will be output.  |
|                          | elevation mask                    | SPP / RTK elevation mask  |
|                          | soln freq                         | The rate at which a solution is generated internally to the Piksi.  |
|                          | dgnss filter                      | Determines the type of carrier phase ambiguity resolution that the Piksi will attempt to achieve.   |
|                          | send heading                      | Enables SBP heading output. Heading is calculated from base station to rover and represents the inverse tangent of the north and east components of the baseline. |
|                          | disable raim                      | Receiver Autonomous Integrity Monitoring  |
| <b>surveyed position</b> | broadcast                         | Broadcast surveyed base station location  |
|                          | surveyed alt                      | Surveyed altitude of the Piksi's antenna  |
|                          | surveyed lat                      | Surveyed latitude of the Piksi's antenna  |
|                          | surveyed lon                      | Surveyed longitude of the Piksi's antenna   |
| <b>system info</b>       | firmware built                    | Date of firmware build  |
|                          | firmware version                  | Indicates the firmware version for the Local Piksi  |
|                          | nap fft index bits                | Number of bits to represent the result of fast fourier transform in SwiftNAP firmware   |
|                          | nap channels                      | Number of tracking channels in the SwiftNAP firmware  |
|                          | serial number                     | The serial number of the Piksi  |
|                          | nap version                       | Version of the SwiftNAP FPGA firmware.  |
|                          | hw revision                       | hardware revision for Piksi   |
| <b>system monitor</b>    | watchdog                          | Enable hardware watchdog timer to reset the Piksi if it locks up for any reason.  |
|                          | heartbeat period milliseconds     | Period for sending the SBP HEARTBEAT messages   |
| <b>telemetry radio</b>   | configuration string              | Configuration string to send radio modem over UART when detected  |
| <b>track</b>             | cn0 use                           | C/N0 threshold for navigation.  |
|                          | cn0 drop                          | C/N0 threshold for tracking.  |
|                          | lock detect params                | PLL lock detector parameters  |
|                          | loop params                       | Tracking loop filter parameters   |
|                          | iq output mask                    | Output raw I/Q correlations   |
|                          | alias detect                      | Use phase-lock alias detection + correction   |
| <b>uart ftdi</b>         | mode                              | Configure mode for USB serial port on Piksi   |
|                          | sbp message mask                  | Configure the message mask for SBP messages on the UART for the USB port on Piksi   |
|                          | fwd msg                           | Enable forwarding of base station messages  |
|                          | baudrate                          | The baudrate for the UART for the USB port on Piksi   |
| <b>uart uarta</b>        | openlog enable                    | Determines whether this UART will attempt to configure an OpenLog   |
|                          | mode                              | Configure mode for UART   |
|                          | sbp message mask                  | Configure the message mask for SBP messages on UART   |
|                          | configure telemetry radio on boot | Determines whether this UART will attempt to configure a telemetry radio upon boot  |
|                          | fwd msg                           | Enable forwarding of base station messages  |
|                          | baudrate                          | The baudrate for the UART   |
| <b>uart uartb</b>        | mode                              | Configure mode for UART   |

|                                      |   |
|--------------------------------------|---|
| openlog enable                       | Determines whether this UART will attempt to configure an OpenLog                     |
| sbp message mask                     | Configure the message mask for SBP messages on UART                                   |
| configure telemetry radio<br>on boot | Determines whether this UART will attempt to configure a telemetry radio<br>upon boot |
| fwd msg                              | Enable forwarding of base station messages  |
| baudrate                             | The baudrate for the uart   |

Table 2.0.1: Summary of message types

DRAFT

## 3 Settings Detail

### 3.1 acquisition

#### 3.1.1 sbas enabled

**Description:** Enable the SBAS constellation

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>acquisition</i> |
| enumerated possible values | <i>true, false</i> |
| name                       | <i>sbasenabled</i> |
| units                      | <i>None</i>        |
| default value              | <i>false</i>       |
| type                       | <i>boolean</i>     |

Table 3.1.1: sbas enabled

**Notes:** None

### 3.2 ext events

#### 3.2.1 edge trigger

**Description:** Select DEBUG0 edges to trigger timestamped event capture.

| Label                      | Value                              |
|----------------------------|------------------------------------|
| group                      | <i>ext events</i>                  |
| enumerated possible values | <i>None, Rising, Falling, Both</i> |
| name                       | <i>edge trigger</i>                |
| units                      | <i>None</i>                        |
| default value              | <i>None</i>                        |
| type                       | <i>enum</i>                        |

Table 3.2.1: edge trigger

**Notes:** You can use this to record the exact time that some external event in your system occurred, e.g. camera shutter time. Upon detecting the event, Piksi will generate a MSG\_EXT\_EVENT message reporting the event, including a timestamp accurate to better than a microsecond. Requires NAP firmware  $\geq 0.12$ .

### 3.3 float kf

#### 3.3.1 phase var

**Description:** Assumed variance of a satellite's phase measurement

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>float kf</i>           |
| name                       | <i>phase var</i>          |
| expert                     | <i>True</i>               |
| enumerated possible values | <i>None</i>               |
| units                      | <i>cycles<sup>2</sup></i> |
| default value              | 0.0144                    |
| type                       | <i>Double</i>             |

Table 3.3.1: phase var

**Notes:** This setting adjusts variance estimates in the Swift Kalman filter which aids in integer ambiguity resolution (IAR). Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

### 3.3.2 code var

**Description:** Assumed variance of a satellite's pseudorange measurement

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>float kf</i>           |
| name                       | <i>code var</i>           |
| expert                     | <i>True</i>               |
| enumerated possible values | <i>None</i>               |
| units                      | <i>meters<sup>2</sup></i> |
| default value              | 40000                     |
| type                       | <i>Double</i>             |

Table 3.3.2: code var

**Notes:** This setting adjusts variance estimates in the Swift Kalman filter which aids in integer ambiguity resolution (IAR). Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

### 3.3.3 amb init var

**Description:** Initial integer ambiguity variance at filter initialization

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>float kf</i>       |
| name                       | <i>amb init var</i>   |
| expert                     | <i>True</i>           |
| enumerated possible values | <i>None</i>           |
| units                      | <i>nondimensional</i> |
| default value              | 1.00E + 25            |
| type                       | <i>Double</i>         |

Table 3.3.3: amb init var

**Notes:** This setting adjusts variance estimates in the Swift Kalman filter which aids in integer ambiguity resolution (IAR). Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

### 3.3.4 new amb var

**Description:** Variance for new ambiguity measurements

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>float kf</i>       |
| name                       | <i>new amb var</i>    |
| expert                     | <i>True</i>           |
| enumerated possible values | <i>None</i>           |
| units                      | <i>nondimensional</i> |
| default value              | <i>1.00E + 25</i>     |
| type                       | <i>Double</i>         |

Table 3.3.4: new amb var

**Notes:** This setting adjusts variance estimates in the Swift Kalman filter which aids in integer ambiguity resolution (IAR). Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

## 3.4 frontend

### 3.4.1 antenna selection

**Description:** Determines which antenna to use.

| Label                      | Value  |
|----------------------------|--|
| group                      | <i>frontend</i>                                |
| enumerated possible values | <i>Auto, Patch, External, External(nobias)</i> |
| name                       | <i>antenna selection</i>                       |
| units                      | <i>None</i>                                    |
| default value              | <i>Auto</i>                                    |
| type                       | <i>enum</i>                                    |

Table 3.4.1: antenna selection

**Notes:** This setting selects the antenna input that should be used by the Piksi. When set to "Auto", if the unit senses an external antenna attached to the Piksi from a load placed on the antenna output DC bias, it will use the external antenna. If no external antenna is attached (or a passive antenna is attached), it will use the integrated patch antenna. Selecting "Patch" or "External" for this setting can override the automatic antenna selection and force the external or patch antenna to be used.

## 3.5 iar

### 3.5.1 phase var

**Description:** Determines the measured carrier phase variance for use in the integer ambiguity resolution test loop

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>iar</i>                |
| name                       | <i>phase var</i>          |
| expert                     | <i>True</i>               |
| enumerated possible values | <i>None</i>               |
| units                      | <i>cycles<sup>2</sup></i> |
| default value              | 0.0144                    |
| type                       | <i>double</i>             |

Table 3.5.1: phase var

**Notes:** This setting adjusts variance estimates in the integer ambiguity resolution (IAR) subroutine. Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

### 3.5.2 code var

**Description:** Determines the pseudocode variance for the integer ambiguity resolution subroutine

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>iar</i>                |
| name                       | <i>code var</i>           |
| expert                     | <i>True</i>               |
| enumerated possible values | <i>None</i>               |
| units                      | <i>meters<sup>2</sup></i> |
| default value              | 40000                     |
| type                       | <i>double</i>             |

Table 3.5.2: code var

**Notes:** This setting adjusts variance estimates in the integer ambiguity resolution (IAR) subroutine. Increasing this value can reduce the occurrence of false carrier phase locks but can also increase the time required to achieve an IAR fixed solution. This setting should not be adjusted by end users.

## 3.6 nmea

### 3.6.1 gppll msg rate

**Description:** Number of ticks between GPPLL NMEA messages being sent.

| Label         | Value                 |
|---------------|-----------------------|
| group         | <i>nmea</i>           |
| units         | <i>Ticks</i>          |
| default value | 10                    |
| type          | <i>integer</i>        |
| name          | <i>gppll msg rate</i> |

Table 3.6.1: gppll msg rate

**Notes:** This setting represents the integer number of solution periods between each transmission of the NMEA message. For example, if the solution rate is 10hz, and this rate setting is 2, the NMEA message will be sent every two solution epochs at a rate of 5hz. If this setting is 0, the msg will be suppressed.

### 3.6.2 gpgsv msg rate

**Description:** Number of ticks between GPGSV NMEA messages being sent.

| Label         | Value                 |
|---------------|-----------------------|
| group         | <i>nmea</i>           |
| units         | <i>Ticks</i>          |
| default value | 10                    |
| type          | <i>integer</i>        |
| name          | <i>gpgsv msg rate</i> |

Table 3.6.2: gpgsv msg rate

**Notes:** This setting represents the integer number of solution periods between each transmission of the NMEA message. For example, if the solution rate is 10hz, and this rate setting is 2, the NMEA message will be sent every two solution epochs at a rate of 5hz. If this setting is 0, the msg will be suppressed.

### 3.6.3 gprmc msg rate

**Description:** Number of ticks between GPRMC NMEA messages being sent.

| Label         | Value                 |
|---------------|-----------------------|
| group         | <i>nmea</i>           |
| units         | <i>Ticks</i>          |
| default value | 10                    |
| type          | <i>integer</i>        |
| name          | <i>gprmc msg rate</i> |

Table 3.6.3: gprmc msg rate

**Notes:** This setting represents the integer number of solution periods between each transmission of the NMEA message. For example, if the solution rate is 10hz, and this rate setting is 2, the NMEA message will be sent every two solution epochs at a rate of 5hz. If this setting is 0, the msg will be suppressed.

### 3.6.4 gpvtg msg rate

**Description:** Number of ticks between GPVTG NMEA messages being sent.

| Label         | Value                 |
|---------------|-----------------------|
| group         | <i>nmea</i>           |
| units         | <i>Ticks</i>          |
| default value | 10                    |
| type          | <i>integer</i>        |
| name          | <i>gpvtg msg rate</i> |

Table 3.6.4: gpvtg msg rate

**Notes:** This setting represents the integer number of solution periods between each transmission of the NMEA message. For example, if the solution rate is 10hz, and this rate setting is 2, the NMEA message will be sent every two solution epochs at a rate of 5hz. If this setting is 0, the msg will be suppressed.

### 3.6.5 gpgsa msg rate

**Description:** Number of ticks between GPGSA NMEA messages being sent.

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>nmea</i>           |
| enumerated possible values | <i>None</i>           |
| name                       | <i>gpgsa msg rate</i> |
| units                      | <i>Ticks</i>          |
| default value              | 10                    |
| type                       | <i>integer</i>        |

Table 3.6.5: gpgsa msg rate

**Notes:** None

### 3.6.6 gpzda msg rate

**Description:** Number of ticks between GPZDA NMEA messages being sent.

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>nmea</i>           |
| enumerated possible values | <i>None</i>           |
| name                       | <i>gpzda msg rate</i> |
| units                      | <i>Ticks</i>          |
| default value              | 10                    |
| type                       | <i>integer</i>        |

Table 3.6.6: gpzda msg rate

**Notes:** None

## 3.7 openlog

### 3.7.1 file prefix

**Description:** Prefix for OpenLog filenames

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>openlog</i>     |
| enumerated possible values | <i>None</i>        |
| name                       | <i>file prefix</i> |
| units                      | <i>None</i>        |
| default value              | <i>PIKSI</i>       |
| type                       | <i>string</i>      |

Table 3.7.1: file prefix

**Notes:** Filenames are generated by combining the specified prefix string with a unique numerical identifier, for example PIKSI001.BIN. Existing filenames will be skipped.

## 3.8 pps

### 3.8.1 width

**Description:** Number of microseconds the PPS will remain high (1-999999).

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>pps</i>          |
| enumerated possible values | <i>None</i>         |
| name                       | <i>width</i>        |
| units                      | <i>microseconds</i> |
| default value              | 200000              |
| type                       | <i>integer</i>      |

Table 3.8.1: width

**Notes:** None

## 3.9 sbp

### 3.9.1 obs msg max size

**Description:** Determines the maximum message length for raw observation sbp messages.

| Label                      | Value                   |
|----------------------------|-------------------------|
| group                      | <i>sbp</i>              |
| enumerated possible values | <i>None</i>             |
| name                       | <i>obs msg max size</i> |
| units                      | <i>bytes</i>            |
| default value              | 102                     |
| type                       | <i>integer</i>          |

Table 3.9.1: obs msg max size

**Notes:** This parameter is useful for tuning observation messages for compatibility with radio modems. Some serial modems will internally split serial packets for their protocol and this parameter allows the size of the message to be reduced as to prevent the modem from sending multiple packets. If the parameter exceeds 255 bytes (the maximum size of an SBP message), the Piksi firmware will ignore the parameter and use 255 bytes. If the parameter is set smaller than the size of one observation, the Piksi firmware will ignore the parameter and use the size of one observation as the maximum message size.

## 3.10 simulator

### 3.10.1 mode mask

**Description:** Determines the types of position outputs for the simulator.

| Label                      | Value   |
|----------------------------|---|
| group                      | <i>simulator</i>                                |
| enumerated possible values | <i>None</i>                                     |
| name                       | <i>mode mask</i>                                |
| units                      | <i>None</i>                                     |
| default value              | 15( <i>decimal</i> ), 0xF( <i>hexadecimal</i> ) |
| type                       | <i>packedbitfield</i>                           |

Table 3.10.1: mode mask

**Notes:** bit 0 (decimal value 1) turns on single point position PVT simulated outputs  
 bit 1 (decimal value 2) turns on the satellite tracking simulated outputs  
 bit 2 (decimal value 4) turns on Float IAR simulated RTK outputs  
 bit 3 (decimal value 8) turns on Fixed IAR simulated RTK outputs

### 3.10.2 radius

**Description:** Radius of the circle around which the simulated Piksi will move

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>simulator</i> |
| enumerated possible values | <i>None</i>      |
| name                       | <i>radius</i>    |
| units                      | <i>meters</i>    |
| default value              | 100              |
| type                       | <i>double</i>    |

Table 3.10.2: radius

**Notes:** None

### 3.10.3 base ecef x

**Description:** Simulated base station position

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>simulator</i>   |
| enumerated possible values | <i>None</i>        |
| name                       | <i>base ecef x</i> |
| units                      | <i>meters</i>      |
| default value              | <i>None</i>        |
| type                       | <i>double</i>      |

Table 3.10.3: base ecef x

**Notes:** Earth centered earth fixed (ECEF) x position of the simulated base station.

### 3.10.4 base ecef y

**Description:** Simulated base station position

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>simulator</i>   |
| enumerated possible values | <i>None</i>        |
| name                       | <i>base ecef y</i> |
| units                      | <i>meters</i>      |
| default value              | <i>None</i>        |
| type                       | <i>double</i>      |

Table 3.10.4: base ecef y

**Notes:** Earth centered earth fixed (ECEF) y position of the simulated base station.

### 3.10.5 base ecef z

**Description:** Simulated base station position

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>simulator</i>   |
| enumerated possible values | <i>None</i>        |
| name                       | <i>base ecef z</i> |
| units                      | <i>meters</i>      |
| default value              | <i>None</i>        |
| type                       | <i>double</i>      |

Table 3.10.5: base ecef z

**Notes:** Earth centered earth fixed (ECEF) z position of the simulated base station.

### 3.10.6 speed

**Description:** Simulated tangential speed of Piksi

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>simulator</i> |
| enumerated possible values | <i>None</i>      |
| name                       | <i>speed</i>     |
| units                      | <i>meters/s</i>  |
| default value              | <i>4</i>         |
| type                       | <i>double</i>    |

Table 3.10.6: speed

**Notes:** None

### 3.10.7 phase sigma

**Description:** Standard deviation of noise added to the simulated carrier phase

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>simulator</i>   |
| enumerated possible values | <i>None</i>        |
| name                       | <i>phase sigma</i> |
| units                      | <i>cycles</i>      |
| default value              | <i>0.0009</i>      |
| type                       | <i>double</i>      |

Table 3.10.7: phase sigma

**Notes:** None

### 3.10.8 pseudorange sigma

**Description:** Standard deviation of noise added to the simulated pseudo range

| Label                      | Value                    |
|----------------------------|--------------------------|
| group                      | <i>simulator</i>         |
| enumerated possible values | <i>None</i>              |
| name                       | <i>pseudorange sigma</i> |
| units                      | <i>meters</i>            |
| default value              | 16                       |
| type                       | <i>double</i>            |

Table 3.10.8: pseudorange sigma

**Notes:** None

### 3.10.9 cn0 sigma

**Description:** Standard deviation of noise added to the simulated signal to noise ratio

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>simulator</i> |
| enumerated possible values | <i>None</i>      |
| name                       | <i>cn0 sigma</i> |
| units                      | <i>dbmhz</i>     |
| default value              | 0.1              |
| type                       | <i>double</i>    |

Table 3.10.9: cn0 sigma

**Notes:** None

### 3.10.10 speed sigma

**Description:** Standard deviation of noise addition to simulated tangential speed.

| Label                      | Value                                   |
|----------------------------|---|
| group                      | <i>simulator</i>                        |
| enumerated possible values | <i>None</i>                             |
| name                       | <i>speed sigma</i>                      |
| units                      | <i>meters<sup>2</sup>/s<sup>2</sup></i> |
| default value              | 0.02                                    |
| type                       | <i>double</i>                           |

Table 3.10.10: speed sigma

**Notes:** None

### 3.10.11 pos sigma

**Description:** Standard deviation of simulated single point position

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>simulator</i>          |
| enumerated possible values | <i>None</i>               |
| name                       | <i>pos sigma</i>          |
| units                      | <i>meters<sup>2</sup></i> |
| default value              | <i>2</i>                  |
| type                       | <i>double</i>             |

Table 3.10.11: pos sigma

**Notes:** None

### 3.10.12 num sats

**Description:** The number of satellites for the simulator.

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>simulator</i> |
| enumerated possible values | <i>None</i>      |
| name                       | <i>num sats</i>  |
| units                      | <i>None</i>      |
| default value              | <i>9</i>         |
| type                       | <i>integer</i>   |

Table 3.10.12: num sats

**Notes:** None

### 3.10.13 enabled

**Description:** Toggles the Piksi internal simulator on and off

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>simulator</i>   |
| enumerated possible values | <i>true, false</i> |
| name                       | <i>enabled</i>     |
| units                      | <i>None</i>        |
| default value              | <i>false</i>       |
| type                       | <i>boolean</i>     |

Table 3.10.13: enabled

**Notes:** The Piksi simulator will provide simulated outputs of a stationary base station and the Local Piksi moving in a circle around the base station. The simulator is intended to aid in system integration by providing realistic looking outputs but does not faithfully simulate every aspect of device operation.

## 3.11 solution

### 3.11.1 known baseline d

**Description:** Determines the baseline vector for the "init known baseline" feature.

| Label                      | Value                   |
|----------------------------|-------------------------|
| group                      | <i>solution</i>         |
| enumerated possible values | <i>None</i>             |
| name                       | <i>known baseline d</i> |
| units                      | <i>meters(down)</i>     |
| default value              | 0                       |
| type                       | <i>double</i>           |

Table 3.11.1: known baseline d

**Notes:** This sets the number of meters that the rover is Down from the base station when the "init known baseline" feature is used.

### 3.11.2 known baseline e

**Description:** Determines the baseline vector for the "init known baseline" feature.

| Label                      | Value                   |
|----------------------------|-------------------------|
| group                      | <i>solution</i>         |
| enumerated possible values | <i>None</i>             |
| name                       | <i>known baseline e</i> |
| units                      | <i>meters(east)</i>     |
| default value              | 0                       |
| type                       | <i>double</i>           |

Table 3.11.2: known baseline e

**Notes:** This sets the number of meters that the rover is East from the base station when the "init known baseline" feature is used.

### 3.11.3 known baseline n

**Description:** Determines the baseline vector for the "init known baseline" feature.

| Label                      | Value                   |
|----------------------------|-------------------------|
| group                      | <i>solution</i>         |
| enumerated possible values | <i>None</i>             |
| name                       | <i>known baseline n</i> |
| units                      | <i>meters(north)</i>    |
| default value              | 0                       |
| type                       | <i>double</i>           |

Table 3.11.3: known baseline n

**Notes:** This sets the number of meters that the rover is North from the base station when the "init known baseline" feature is used.

### 3.11.4 dgns solution mode

**Description:** Determines the type of RTK solution which will be output.

| Label                      | Value                          |
|----------------------------|--------------------------------|
| group                      | <i>solution</i>                |
| enumerated possible values | <i>LowLatency, TimeMatched</i> |
| name                       | <i>dgns solution mode</i>      |
| units                      | <i>None</i>                    |
| default value              | <i>None</i>                    |
| type                       | <i>enum</i>                    |

Table 3.11.4: dgns solution mode

**Notes:** A "Low Latency" solution uses an internal model of anticipated satellite observations to provide RTK output with minimal latency but slightly reduced accuracy. "Low Latency" mode assumes that the base station is stationary. For applications where accuracy is desired over timeliness or when both Piksi's are moving, "Time matched" mode can be chosen. This means that the RTK output will require a corresponding set of correction observations for each timestamp.

### 3.11.5 output every n obs

**Description:** Integer divisor of solution frequency for which the observations will be output.

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>solution</i>           |
| enumerated possible values | <i>None</i>               |
| name                       | <i>output every n obs</i> |
| units                      | <i>None</i>               |
| default value              | <i>2</i>                  |
| type                       | <i>integer</i>            |

Table 3.11.5: output every n obs

**Notes:** For instance, if the solution frequency is 10 hz, and the "output every n obs" parameter is 2, it means that the observation output will occur at a rate of 5hz. Since the observations are the information used by the Piksi receiving corrections from the connected Piksi, this determines the rate of information sharing for RTK solution output. This parameter is designed to tune the rate at which correction information is passed from one Piksi to the other as to efficiently use radio modem bandwidth and fit with user applications.

### 3.11.6 elevation mask

**Description:** SPP / RTK elevation mask

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>solution</i>       |
| enumerated possible values | <i>None</i>           |
| name                       | <i>elevation mask</i> |
| units                      | <i>degrees</i>        |
| default value              | <i>5</i>              |
| type                       | <i>float</i>          |

Table 3.11.6: elevation mask

**Notes:** Satellites must be above the horizon by at least this angle before they will be used in a solution.

### 3.11.7 soln freq

**Description:** The rate at which a solution is generated internally to the Piksi.

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>solution</i>  |
| enumerated possible values | <i>None</i>      |
| name                       | <i>soln freq</i> |
| units                      | <i>hz</i>        |
| default value              | <i>10</i>        |
| type                       | <i>integer</i>   |

Table 3.11.7: soln freq

**Notes:** None

### 3.11.8 dgnss filter

**Description:** Determines the type of carrier phase ambiguity resolution that the Piksi will attempt to achieve.

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>solution</i>     |
| name                       | <i>dgnss filter</i> |
| expert                     | <i>True</i>         |
| enumerated possible values | <i>Fixed, Float</i> |
| units                      | <i>None</i>         |
| default value              | <i>Fixed</i>        |
| type                       | <i>enum</i>         |

Table 3.11.8: dgnss filter

**Notes:** If "fixed", the Piksi will output a integer fixed ambiguity estimate. If no fixed solution is available, it will revert to the float solution. If "float", the device will only output the float ambiguity estimate.

### 3.11.9 send heading

**Description:** Enables SBP heading output. Heading is caculated from base station to rover and represents the inverse tangent of the north and east components of the baseline.

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>solution</i>     |
| name                       | <i>send heading</i> |
| expert                     | <i>True</i>         |
| enumerated possible values | <i>True, False</i>  |
| units                      | <i>None</i>         |
| default value              | <i>False</i>        |
| type                       | <i>boolean</i>      |

Table 3.11.9: send heading

**Notes:** No smoothing or additional processing is provided to improve heading output.

### 3.11.10 disable raim

**Description:** Receiver Autonomous Integrity Monitoring

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>solution</i>     |
| name                       | <i>disable raim</i> |
| expert                     | <i>True</i>         |
| enumerated possible values | <i>True, False</i>  |
| units                      | <i>None</i>         |
| default value              | <i>False</i>        |
| type                       | <i>boolean</i>      |

Table 3.11.10: disable raim

**Notes:** If True, RAIM checks will not be performed.

## 3.12 surveyed position

### 3.12.1 broadcast

**Description:** Broadcast surveyed base station location

| Label                      | Value                    |
|----------------------------|--------------------------|
| group                      | <i>surveyed position</i> |
| enumerated possible values | <i>true, false</i>       |
| name                       | <i>broadcast</i>         |
| units                      | <i>None</i>              |
| default value              | <i>false</i>             |
| type                       | <i>boolean</i>           |

Table 3.12.1: broadcast

**Notes:** This flag ultimately determines whether the SBP message with identifier MSG\_BASE\_POS\_ECEF will be calculated and sent. Logically, setting this attribute to "true" sets the Local Piksi as a base station and configures the unit to send its surveyed location coordinates to the other Piksi(s) with which the base station is communicating. If "true", the remote Piksi that receives the surveyed position will calculate and communicate a pseudo absolute RTK position based upon the received position.

### 3.12.2 surveyed alt

**Description:** Surveyed altitude of the Piksi's antenna

| Label                      | Value                    |
|----------------------------|--------------------------|
| group                      | <i>surveyed position</i> |
| enumerated possible values | <i>None</i>              |
| name                       | <i>surveyed alt</i>      |
| units                      | <i>meters</i>            |
| default value              | <i>0</i>                 |
| type                       | <i>Double</i>            |

Table 3.12.2: surveyed alt

**Notes:** This setting represents the altitude of the Piksi's antenna above the WGS84 ellipsoid, in meters. If surveyed position "broadcast" is set to "true", this coordinate will be communicated to remote Piks for use in calculating their pseudo-absolute position. This value should be precise to 1 cm. Any errors in the surveyed position will directly affect the pseudo-absolute RTK position measurement reported by the Rover.

### 3.12.3 surveyed lat

**Description:** Surveyed latitude of the Piksi's antenna

| Label                      | Value                    |
|----------------------------|--------------------------|
| group                      | <i>surveyed position</i> |
| enumerated possible values | <i>None</i>              |
| name                       | <i>surveyed lat</i>      |
| units                      | <i>degrees</i>           |
| default value              | <i>0</i>                 |
| type                       | <i>Double</i>            |

Table 3.12.3: surveyed lat

**Notes:** This setting represents the latitude of the local Piksi's antenna, expressed in decimal degrees relative to the equator (north = positive, south = negative). If surveyed position "broadcast" is set to "true", the coordinate will be communicated to remote Piskis for use in calculating their pseudo-absolute RTK position. The value should be as accurate as possible and should have precision to at least 7 digits following the decimal point. For reference, 1e-7 degrees of latitude is about 1.1 cm on the surface of the earth. Any errors in the surveyed position will directly affect the pseudo-absolute RTK position measurement reported by the remote Piksi.

### 3.12.4 surveyed lon

**Description:** Surveyed longitude of the Piksi's antenna

| Label                      | Value                    |
|----------------------------|--------------------------|
| group                      | <i>surveyed position</i> |
| enumerated possible values | <i>None</i>              |
| name                       | <i>surveyed lon</i>      |
| units                      | <i>degrees</i>           |
| default value              | 0                        |
| type                       | <i>Double</i>            |

Table 3.12.4: surveyed lon

**Notes:** This setting represents the longitude of the local Piksi's antenna, expressed in decimal degrees relative to the Prime Meridian (east = positive, west = negative). If surveyed position "broadcast" is set to "true", the coordinate will be communicated to remote Piskis for use in calculating their pseudo-absolute RTK position. The value should be as accurate as possible and should have precision to at least 7 digits following the decimal point. For reference, 1e-7 degrees of longitude at 35 degree latitude is about 1 cm. Any errors in the surveyed position will directly affect the pseudo-absolute RTK position measurement reported by the remote Piksi.

## 3.13 system info

### 3.13.1 firmware built

**Description:** Date of firmware build

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>system info</i>    |
| enumerated possible values | <i>None</i>           |
| name                       | <i>firmware built</i> |
| units                      | <i>None</i>           |
| default value              | <i>None</i>           |
| type                       | <i>string</i>         |

Table 3.13.1: firmware built

**Notes:** None

### 3.13.2 firmware version

**Description:** Indicates the firmware version for the Local Piksi

| Label                      | Value                   |
|----------------------------|-------------------------|
| group                      | <i>system info</i>      |
| enumerated possible values | <i>None</i>             |
| name                       | <i>firmware version</i> |
| units                      | <i>None</i>             |
| default value              | <i>None</i>             |
| type                       | <i>string</i>           |

Table 3.13.2: firmware version

**Notes:** For user generated firmware, this information will appear the same as the git command: "git describe --dirty"

### 3.13.3 nap fft index bits

**Description:** Number of bits to represent the result of fast fourier transform in SwiftNAP firmware

| Label                      | Value                     |
|----------------------------|---------------------------|
| group                      | <i>system info</i>        |
| enumerated possible values | <i>None</i>               |
| name                       | <i>nap fft index bits</i> |
| units                      | <i>None</i>               |
| default value              | <i>None</i>               |
| type                       | <i>None</i>               |

Table 3.13.3: nap fft index bits

**Notes:** None

### 3.13.4 nap channels

**Description:** Number of tracking channels in the SwiftNAP firmware

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>system info</i>  |
| enumerated possible values | <i>None</i>         |
| name                       | <i>nap channels</i> |
| units                      | <i>None</i>         |
| default value              | <i>None</i>         |
| type                       | <i>integer</i>      |

Table 3.13.4: nap channels

**Notes:** None

### 3.13.5 serial number

**Description:** The serial number of the Piksi

| Label                      | Value                |
|----------------------------|----------------------|
| group                      | <i>system info</i>   |
| enumerated possible values | <i>None</i>          |
| name                       | <i>serial number</i> |
| units                      | <i>None</i>          |
| default value              | <i>None</i>          |
| type                       | <i>integer</i>       |

Table 3.13.5: serial number

**Notes:** This number should match the number on the barcode and cannot be modified

### 3.13.6 nap version

**Description:** Version of the SwiftNAP FPGA firmware.

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>system info</i> |
| enumerated possible values | <i>None</i>        |
| name                       | <i>nap version</i> |
| units                      | <i>None</i>        |
| default value              | <i>None</i>        |
| type                       | <i>integer</i>     |

Table 3.13.6: nap version

**Notes:** None

### 3.13.7 hw revision

**Description:** hardware revision for Piksi

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>system info</i> |
| enumerated possible values | <i>None</i>        |
| name                       | <i>hw revision</i> |
| units                      | <i>None</i>        |
| default value              | <i>None</i>        |
| type                       | <i>string</i>      |

Table 3.13.7: hw revision

**Notes:** None

## 3.14 system monitor

### 3.14.1 watchdog

**Description:** Enable hardware watchdog timer to reset the Pixsi if it locks up for any reason.

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>system monitor</i> |
| enumerated possible values | <i>true, false</i>    |
| name                       | <i>watchdog</i>       |
| units                      | <i>None</i>           |
| default value              | <i>true</i>           |
| type                       | <i>boolean</i>        |

Table 3.14.1: watchdog

**Notes:** You must reset the Pixsi for changes to this setting to take effect.

### 3.14.2 heartbeat period milliseconds

**Description:** Period for sending the SBP\_HEARTBEAT messages

| Label                      | Value                                |
|----------------------------|--------------------------------------|
| group                      | <i>system monitor</i>                |
| enumerated possible values | <i>None</i>                          |
| name                       | <i>heartbeat period milliseconds</i> |
| units                      | <i>None</i>                          |
| default value              | <i>None</i>                          |
| type                       | <i>integer</i>                       |

Table 3.14.2: heartbeat period milliseconds

**Notes:** None

## 3.15 telemetry radio

### 3.15.1 configuration string

**Description:** Configuration string to send radio modem over UART when detected

| Label                      | Value                       |
|----------------------------|-----------------------------|
| group                      | <i>telemetry radio</i>      |
| enumerated possible values | <i>None</i>                 |
| name                       | <i>configuration string</i> |
| units                      | <i>None</i>                 |
| default value              | <i>None</i>                 |
| type                       | <i>string</i>               |

Table 3.15.1: configuration string

**Notes:** This configuration string is intended for radios that use AT style commands

ATS1 = Serial Baud Rate

ATS2 = Air Speed

ATS3 = Net ID

ATS4 = TX Power

ATS5 = Error Correction

ATS8 = Minimum Frequency

ATS9 = Maximum Frequency

ATS15 = Node ID

## 3.16 track

### 3.16.1 cn0 use

**Description:** C/N0 threshold for navigation.

| Label         | Value          |
|---------------|----------------|
| group         | <i>track</i>   |
| name          | <i>cn0 use</i> |
| expert        | <i>True</i>    |
| units         | <i>db - Hz</i> |
| default value | 31             |
| type          | <i>Double</i>  |

Table 3.16.1: cn0 use

**Notes:** If the estimated C/N0 drops below this even momentarily, the satellite will not be used for SPP or RTK solutions and the integer ambiguity for that channel will be reinitialized. This is in addition to PLL lock detection.

### 3.16.2 cn0 drop

**Description:** C/N0 threshold for tracking.

| Label         | Value           |
|---------------|-----------------|
| group         | <i>track</i>    |
| name          | <i>cn0 drop</i> |
| expert        | <i>True</i>     |
| units         | <i>db - Hz</i>  |
| default value | 30              |
| type          | <i>Double</i>   |

Table 3.16.2: cn0 drop

**Notes:** If the estimated C/N0 for a satellite drops below this for more than 5 seconds, the signal will be considered lost and the channel reset.

### 3.16.3 lock detect params

**Description:** PLL lock detector parameters

| Label         | Value                     |
|---------------|---------------------------|
| group         | <i>track</i>              |
| name          | <i>lock detect params</i> |
| expert        | <i>True</i>               |
| units         | <i>None</i>               |
| default value | 0.02, 1.4, 150, 50        |
| type          | <i>string</i>             |

Table 3.16.3: lock detect params

**Notes:** <k1>, <k2>, <lp>, <lo>

where

k1 = LPF coefficient (@ 1 ms)

k2 = I arm divisor

lp = Pessimistic lock count threshold

lo = Optimistic lock count threshold

### 3.16.4 loop params

**Description:** Tracking loop filter parameters

| Label         | Value  |
|---------------|--|
| group         | <i>track</i>   |
| name          | <i>loop params</i>   |
| expert        | <i>True</i>  |
| units         | <i>None</i>  |
| default value | (1ms, (1, 0.7, 1, 1540), (10, 0.7, 1, 5)), (5ms, (1, 0.7, 1, 1540), (50, 0.7, 1, 0)) |
| type          | <i>string</i>  |

Table 3.16.4: loop params

**Notes:** '<LOOP\_PARAMS\_STAGE1>[, <LOOP\_PARAMS\_STAGE2>]'

where <LOOP\_PARAMS\_STAGEn>=

(<COHERENT\_MS>ms, (CODE\_BW, CODE\_ZETA, CODE\_K, CARR\_TO\_CODE),  
(CARR\_BW, CARR\_ZETA, CARR\_K, FLL\_AID\_GAIN))

LOOP\_PARAMS\_STAGE1 will be used until navigation bit synchronization is achieved, after which LOOP\_PARAMS\_STAGE2 will be used.

COHERENT\_MS must be a factor of 20, and must be 1 for LOOP\_PARAMS\_STAGE1.

CARR\_TO\_CODE should be 0 (carrier aiding disabled) or 1540 (ratio of GPS L1 C/A carrier freq to code freq).

### 3.16.5 iq output mask

**Description:** Output raw I/Q correlations

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>track</i>          |
| name                       | <i>iq output mask</i> |
| expert                     | <i>True</i>           |
| enumerated possible values | <i>None</i>           |
| units                      | <i>None</i>           |
| default value              | <i>None</i>           |
| type                       | <i>integer</i>        |

Table 3.16.5: iq output mask

**Notes:** Bitmask of channel IDs (not PRNs)

### 3.16.6 alias detect

**Description:** Use phase-lock alias detection + correction

| Label                      | Value               |
|----------------------------|---------------------|
| group                      | <i>track</i>        |
| name                       | <i>alias detect</i> |
| expert                     | <i>True</i>         |
| enumerated possible values | <i>True, False</i>  |
| units                      | <i>None</i>         |
| type                       | <i>boolean</i>      |

Table 3.16.6: alias detect

**Notes:** None

## 3.17 uart ftdi

### 3.17.1 mode

**Description:** Configure mode for USB serial port on Piksi

| Label                      | Value                  |
|----------------------------|------------------------|
| group                      | <i>uart ftdi</i>       |
| enumerated possible values | <i>SBP, NMEA, RTCM</i> |
| name                       | <i>mode</i>            |
| units                      | <i>None</i>            |
| default value              | <i>SBP</i>             |
| type                       | <i>enum</i>            |

Table 3.17.1: mode

**Notes:** None

### 3.17.2 sbp message mask

**Description:** Configure the message mask for SBP messages on the UART for the USB port on Pixi

| Label                      | Value                              |
|----------------------------|------------------------------------|
| group                      | <i>uart ftdi</i>                   |
| enumerated possible values | <i>None</i>                        |
| name                       | <i>sbp message mask</i>            |
| units                      | <i>None</i>                        |
| default value              | <i>65535(decimal), 0xFFFF(hex)</i> |
| type                       | <i>integer</i>                     |

Table 3.17.2: sbp message mask

**Notes:** The message mask is bitwise anded to the message identifier for a particular message. If the result is non-zero, the message will be sent over this UART. For example, consider the Pixi firmware sending an SBP message with ID 0x0041. If UART A has mask "64" (0x0040), The SBP subsystem bitwise-and the message id with the UART A mask giving the result of 0x0040. Since the result is non-zero, the message is valid for UART A and is sent. Practically, the UART with mask 64 (0x0040) transmits only RTK observation data and the USART with mask 65280 (0xFF00) transmits most messages of interest to the host system (such as position and velocity). A mask of 0xFFFF will transmit all messages at the expense of bandwidth.

### 3.17.3 fwd msg

**Description:** Enable forwarding of base station messages

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>uart ftdi</i>   |
| enumerated possible values | <i>true, false</i> |
| name                       | <i>fwd msg</i>     |
| units                      | <i>None</i>        |
| default value              | <i>true</i>        |
| type                       | <i>boolean</i>     |

Table 3.17.3: fwd msg

**Notes:** None

### 3.17.4 baudrate

**Description:** The baudrate for the UART for the USB port on Pixi

| Label                      | Value            |
|----------------------------|------------------|
| group                      | <i>uart ftdi</i> |
| enumerated possible values | <i>None</i>      |
| name                       | <i>baudrate</i>  |
| units                      | <i>baud</i>      |
| default value              | 1000000          |
| type                       | <i>integer</i>   |

Table 3.17.4: baudrate

**Notes:** None

## 3.18 uart uarta

### 3.18.1 openlog enable

**Description:** Determines whether this UART will attempt to configure an OpenLog

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>uart uarta</i>     |
| enumerated possible values | <i>true, false</i>    |
| name                       | <i>openlog enable</i> |
| units                      | <i>None</i>           |
| default value              | <i>TRUE</i>           |
| type                       | <i>boolean</i>        |

Table 3.18.1: openlog enable

### 3.18.2 mode

**Description:** Configure mode for UART

| Label                      | Value                  |
|----------------------------|------------------------|
| group                      | <i>uart uarta</i>      |
| enumerated possible values | <i>SBP, NMEA, RTCM</i> |
| name                       | <i>mode</i>            |
| units                      | <i>None</i>            |
| default value              | <i>SBP</i>             |
| type                       | <i>enum</i>            |

Table 3.18.2: mode

**Notes:** None

### 3.18.3 sbp message mask

**Description:** Configure the message mask for SBP messages on UART

| Label                      | Value                           |
|----------------------------|---------------------------------|
| group                      | <i>uart uarta</i>               |
| enumerated possible values | <i>None</i>                     |
| name                       | <i>sbp message mask</i>         |
| units                      | <i>None</i>                     |
| default value              | <i>64(decimal), 0x0040(hex)</i> |
| type                       | <i>integer</i>                  |

Table 3.18.3: sbp message mask

**Notes:** The default message mask on this UART (0x0040) is appropriate for a radio to communicate observation messages to another Piksi. The out-of-the box configuration uses UART A for Piksi to Piksi communication.

### 3.18.4 configure telemetry radio on boot

**Description:** Determines whether this UART will attempt to configure a telemetry radio upon boot

| Label                      | Value                                    |
|----------------------------|--|
| group                      | <i>uart uarta</i>                        |
| enumerated possible values | <i>true, false</i>                       |
| name                       | <i>configure telemetry radio on boot</i> |
| units                      | <i>None</i>                              |
| default value              | <i>TRUE</i>                              |
| type                       | <i>boolean</i>                           |

Table 3.18.4: configure telemetry radio on boot

**Notes:** If a telemetry radio is connected to this UART, this should be set to true in order to send the configuration string to the radio.

### 3.18.5 fwd msg

**Description:** Enable forwarding of base station messages

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>uart uarta</i>  |
| enumerated possible values | <i>true, false</i> |
| name                       | <i>fwd msg</i>     |
| units                      | <i>None</i>        |
| default value              | <i>false</i>       |
| type                       | <i>boolean</i>     |

Table 3.18.5: fwd msg

**Notes:** None

### 3.18.6 baudrate

**Description:** The baudrate for the UART

| Label                      | Value             |
|----------------------------|-------------------|
| group                      | <i>uart uarta</i> |
| enumerated possible values | <i>None</i>       |
| name                       | <i>baudrate</i>   |
| units                      | <i>baud</i>       |
| default value              | <i>57600</i>      |
| type                       | <i>integer</i>    |

Table 3.18.6: baudrate

**Notes:** The radio baudrate may be constrained by the particular RF equipment used for the telemetry radio.

## 3.19 uart uartb

### 3.19.1 mode

**Description:** Configure mode for UART

| Label                      | Value                  |
|----------------------------|------------------------|
| group                      | <i>uart uartb</i>      |
| enumerated possible values | <i>SBP, NMEA, RTCM</i> |
| name                       | <i>mode</i>            |
| units                      | <i>None</i>            |
| default value              | <i>SBP</i>             |
| type                       | <i>enum</i>            |

Table 3.19.1: mode

### 3.19.2 openlog enable

**Description:** Determines whether this UART will attempt to configure an OpenLog

| Label                      | Value                 |
|----------------------------|-----------------------|
| group                      | <i>uart uartb</i>     |
| enumerated possible values | <i>true, false</i>    |
| name                       | <i>openlog enable</i> |
| units                      | <i>None</i>           |
| default value              | <i>TRUE</i>           |
| type                       | <i>boolean</i>        |

Table 3.19.2: openlog enable

### 3.19.3 sbp message mask

**Description:** Configure the message mask for SBP messages on UART

| Label                      | Value                              |
|----------------------------|------------------------------------|
| group                      | <i>uart uartb</i>                  |
| enumerated possible values | <i>None</i>                        |
| name                       | <i>sbp message mask</i>            |
| units                      | <i>None</i>                        |
| default value              | <i>65280(decimal), 0xFF00(hex)</i> |
| type                       | <i>integer</i>                     |

Table 3.19.3: sbp message mask

**Notes:** The default message mask on this uart (0xFF00) is appropriate for a general purpose interface to the Piksi.

### 3.19.4 configure telemetry radio on boot

**Description:** Determines whether this UART will attempt to configure a telemetry radio upon boot

| Label                      | Value                                    |
|----------------------------|--|
| group                      | <i>uart uartb</i>                        |
| enumerated possible values | <i>true, false</i>                       |
| name                       | <i>configure telemetry radio on boot</i> |
| units                      | <i>None</i>                              |
| default value              | <i>TRUE</i>                              |
| type                       | <i>boolean</i>                           |

Table 3.19.4: configure telemetry radio on boot

**Notes:** If a telemetry radio is connected to this UART, this should be set to true in order to send the configuration string to the radio.

### 3.19.5 fwd msg

**Description:** Enable forwarding of base station messages

| Label                      | Value              |
|----------------------------|--------------------|
| group                      | <i>uart uartb</i>  |
| enumerated possible values | <i>true, false</i> |
| name                       | <i>fwd msg</i>     |
| units                      | <i>None</i>        |
| default value              | <i>false</i>       |
| type                       | <i>boolean</i>     |

Table 3.19.5: fwd msg

**Notes:** None

### 3.19.6 baudrate

**Description:** The baudrate for the uart

| Label                      | Value             |
|----------------------------|-------------------|
| group                      | <i>uart uartb</i> |
| enumerated possible values | <i>None</i>       |
| name                       | <i>baudrate</i>   |
| units                      | <i>baud</i>       |
| default value              | 115200            |
| type                       | <i>integer</i>    |

Table 3.19.6: baudrate

**Notes:** None
